Introduction

What is a defualt app?

Extensions are what differntaite files, there are countless files types and there are also countless applications which are designed to deal with each of those file types.

A default app is an application which is assigned to deal with a specific file type (extension), so that app will always open files of that said extension everytime.

Doesn't windows settings allow you to choose default apps?

This valids only for the PC counterpart; Windows 10.

It was said the default app settings will arrive with the creators update back in 2017 but only Windows 10 got it, **Windows 10 Mobile didn't get almost any of the major changes.**

That's why this guide exists to manually manage default apps in Windows 10 Mobile.

| NOTE

Not every app is capable of handling every File type, so don't assign Apps to a file type which isn't designed to handle that type of files.

Preparations

Download Interop Tools & install in your Lumia.

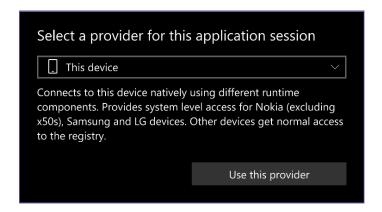

MEGA

Manage Default apps for the existing file types (extensions)

> Open Interop Tools.

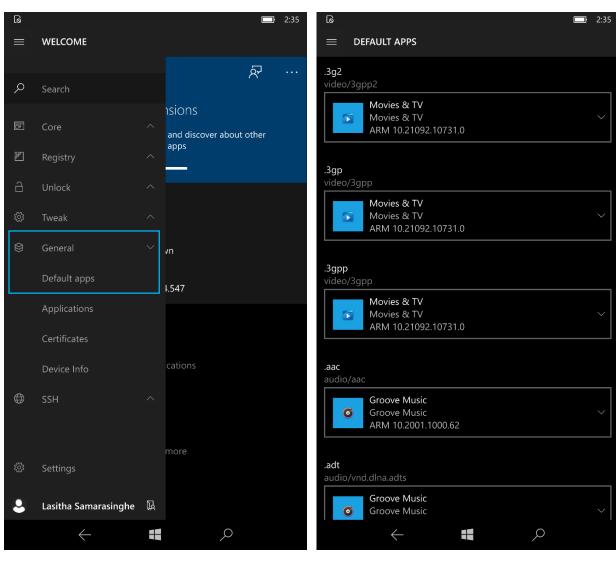

Choose "This Device" as the registry provider.

> Open the side menu & expand the **General** section.

There, click **Default apps** entry.

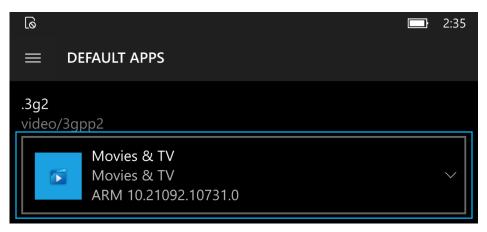

That will list all the default apps list for the existing file types (extensions) in your device.

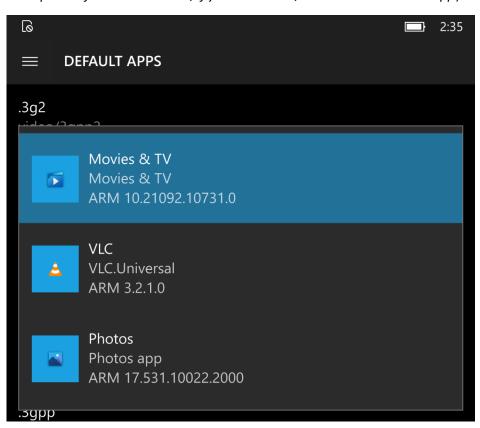

> In the list, find the file type (extension) you wanted.

Click on the default application details right below the extension you want to change.

> Choose the application you want from the list.

(It will only display apps which are installed & are compatible for that extension, if you have none, there will be no other app)

> Then, reboot the phone to apply the default app after changing it.

| EXTENSION YOU WANT IS MISSING IN THE LIST?

Then, that extension isn't registered currently in your system.

You will need to manually add it, for that, refer to the below topic!

Manually set-up default app for new file types

I will separate the two main steps that has to be done to achieve this;

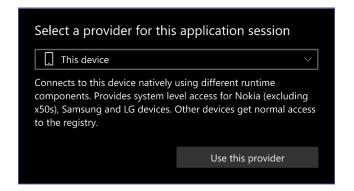

- 1. Obtain the "Family Name" of the Default app
- 2. Assign Default app to the File type in registry

Obtain the "Family Name" of the Default app

TIP: The applications which you wish to set as the Default app must be already installed in the system.

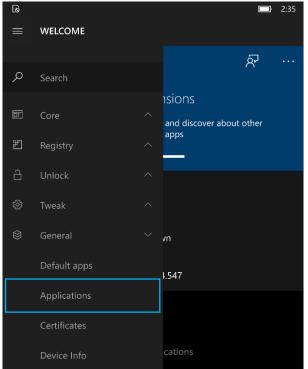

> Open Interop Tools.

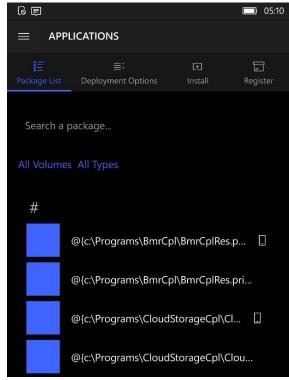

Choose "This Device" as the registry provider.

> Open the side menu & expand the **General** section & click on **Applications**.

Swipe left to go to Package List.

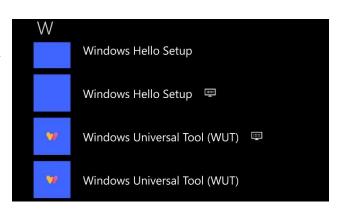

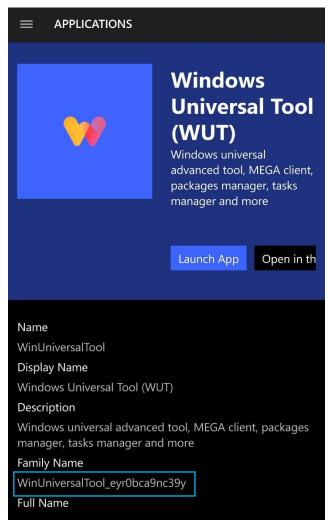

LAST UPDATE: 6/11/2023

- > Find the application you want among the list.
- > Click on it to see details of the application,

TIP: If there are several instances to the same application name, click on any one of them.

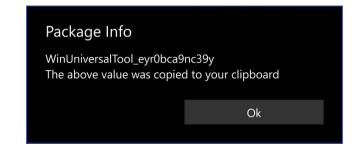

> There click on the text right below the Family Name heading
(The highlighted area in the sample image)

It will be automatically copied to your clipboard.

That's it for this step, now is to assign it in registry! Proceed on.

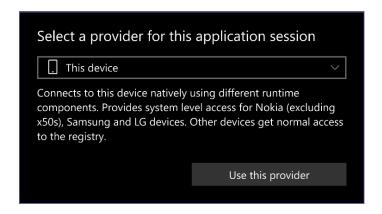

Assign defualt app to the File type in registry

> Open Interop Tools.

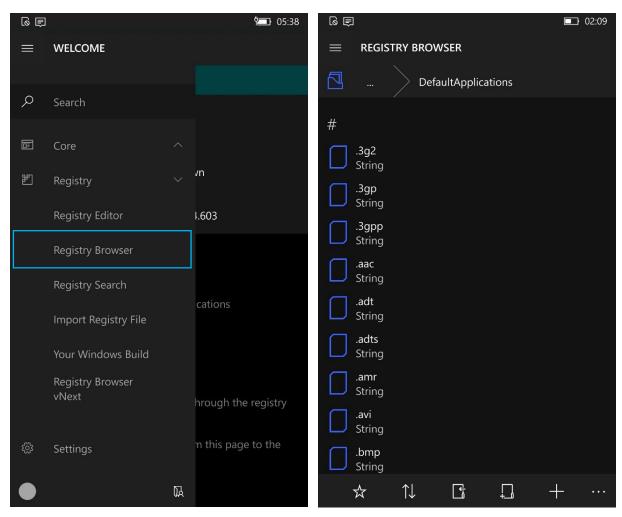

Choose "This Device" as the registry provider.

> Open the side menu & expand the **Registry** section.

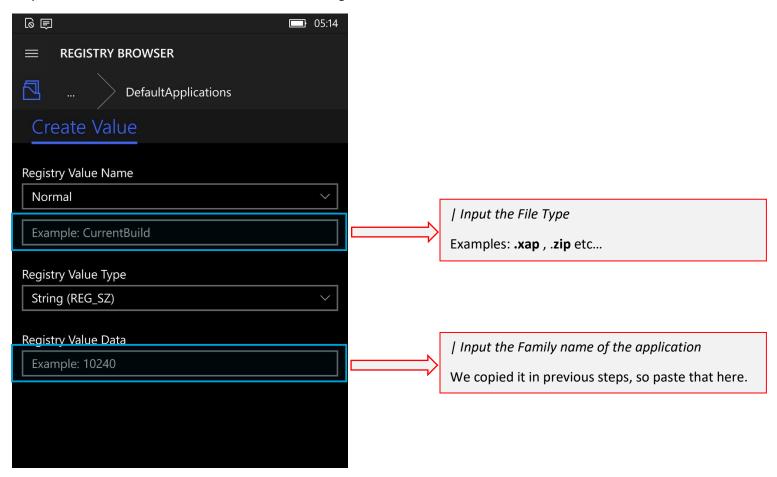

There, click **Registry Browser** entry & navigate to the below path.

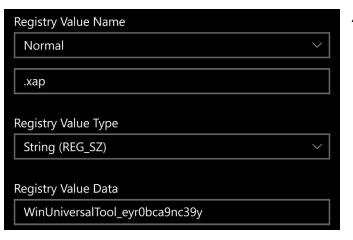

HKEY_LOCAL_MACHINE (HKLM) → SOFTWARE → Microsoft → DefaultApplications

All you need to do now is to fill these two boxes with right data.

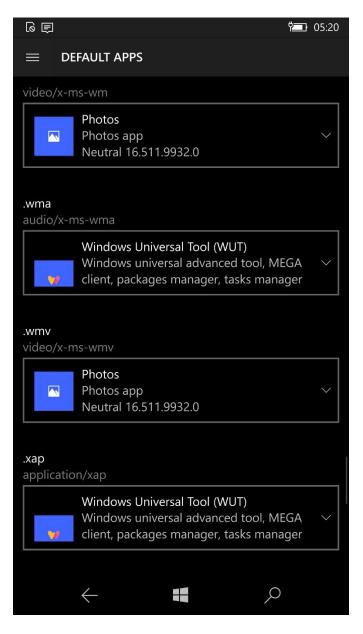

An example image for better understanding

> Once you are done with filling, click on the tick (\checkmark) in the bottom bar to save it.

Then restart your phone to apply the changes.

- > Once the phone boots back, go to Default Apps section in Interop Tools applications (As in here)
- > Swipe to the bottom of the page & you will now see the extension you just added along with the default app already assigned.

You are now able to even change it right from there just as you do normally!

Do the same procedure for other file types you want to add.

Enjoy!

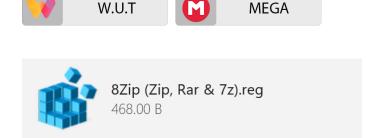

BONUS: Default application REG files

These are completely optional.

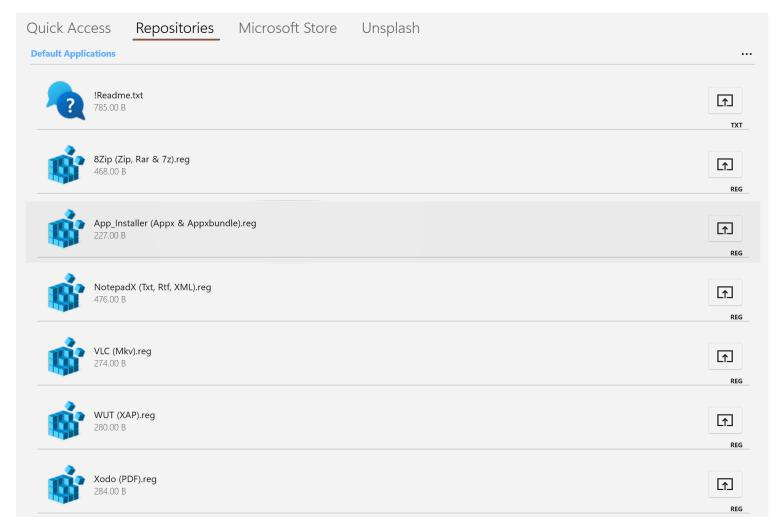

Because these REG files are created just to make the above process of manually setting default apps easier for certain file types with fixed default applications.

Grab the REG file/s you need from the below links.

The **Default app is the starting word/s** (In the above example: 8ZIP application)

The Assigned File types are in the brackets (In the above example: ZIP, RAR, 7Z extensions are assigned)
